

Manufacturing Process Stage 5 - Metal Finishing

The final product is **slit to width** and **cut to length**. Some specific **surface finishes** can also be made. Those metal finishing operations are carried out in our production sites and through our network of service centres. Our materials are **100% recyclable** at the end of their life.

During finishing the material is given its **final surface finish** appearance, as required by the customer's order. There are different operations such as: **polishing, brushing or other special processes**.

The last operation is where the **final form of the material** is achieved: Coils can be **cut to length** to obtain **sheets**, blanks or discs.

Coils can also be **slit to width** in strip and **narrow strip** and blanks.

Through other processes, we can produce other finished products like **tubes**, made by **forming** and then **welding** the flat products.
